BRAND STRATEGY / PRODUCT EXPERIENCE

Javi’s Dog

Every agent. One clear signal.

A loyal companion for the agentic coding world — built to turn scattered coding signals into clear operational insight.

CREATIVE DIRECTION | UX CONCEPT | TECH ROADMAP

Concept 0.1 · 21 October 2026

The agent work is everywhere. The signal is not.

Vibe coding creates parallel work across tools — but operators still need one place to understand what is really happening.

01

Hidden execution state

Is the agent working, waiting, looping or already failed?

02

Invisible resource burn

Token and context limits can interrupt long-running work.

03

Fragmented evidence

The story is scattered across IDEs, terminals and Git history.

THE OPPORTUNITY

One operating picture for every agent.

A privacy-aware telemetry layer for project health, thread state, usage and attention signals — independent of the coding tool.

OBSERVE

EXPLAIN

COORDINATE

A companion, not another control panel.

The dog represents alertness and loyalty; the product earns trust through data fidelity, privacy boundaries and evidence.

POSITIONING STATEMENT

For vibe coders who run multiple AI agents, Javi's Dog is the observability companion that turns fragmented execution signals into one clear operating picture.

Unlike a task board, it watches the runtime signals beneath the work.

Solo vibe coders

Need to see agent status, context and spend without juggling tabs.

Technical founders

Need project health and visibility into resource risk.

Small dev teams

Need comparable signals across coding environments.

Future contributors

May coordinate compliant capacity/credits after policy and economics are validated.

Three jobs Javi’s Dog should do exceptionally well.

Keep the MVP narrow enough to prove signal quality before expanding into resource exchange.

01

OBSERVE

See every project, thread and agent in one place.

Status · Heartbeat · Event timeline

02

UNDERSTAND

Make resource consumption and failure patterns explainable.

Token deltas · Retries · Budget guardrails

03

KEEP THE FLOW

Spot attention needs early and coordinate next steps.

Stale-run alerts · Safe interventions · Future pool

MVP promise: a trustworthy operating picture — not an unverified promise of autonomous orchestration.

Serious signals. Human language.

Inspired by approachable work software, with an original Javi's Dog voice and visual grammar.

Attentive	Notices drift and missing signals
Smart	Explains what happened, with evidence
Playful	Makes complex operations feel approachable
Trustworthy	Labels uncertainty and stale data honestly

VOICE EXAMPLES

"Your pack is in motion."

"One thread needs your attention."

"Connection not verified yet."

Be warm, brief and concrete. Never call a connection live, encrypted or secure until runtime evidence proves it.

Avoid: hype, alarm fatigue, cartoon overload and false certainty.

A signal hound, built from modular geometry.

Original mark direction: a friendly dog face with alert ears, signal-dot eyes and a mint tile. Final trademark/name clearance remains separate.

COLOR PALETTE

Pack Night
#252347

Signal Violet
#6E62F6

Good Signal Mint
#A0EBC2

Alert Coral
#FF907E

Focus Yellow
#FFE18C

Clear Sky

Aa Inter / clean, friendly, operational

Headlines: bold · Metrics: tabular · IDs: mono

Shape language: rounded 16–20 px cards · restrained shadow · status pills + labels · 4/8 px spacing rhythm.

Playful outside. Precise where it counts.

The UI should feel welcoming without sacrificing scanability during a failure or a quota spike.

UX PRINCIPLES

1. **Signal before spectacle**

   Critical status is visible without hunting.

2. **Live means verified**

   Show source, last heartbeat and stale state.

3. **Privacy by minimization**

   No prompt or source code in default payload.

4. **No mock masquerading as product**

   Actions disclose when a backend is absent.

Five core spaces. One product story.

Designed for a developer's daily loop: scan health → inspect a project → diagnose a thread → manage limits → configure the signal contract.

01 Overview

What is happening now?

02 Projects

Where is risk building?

03 Live agents

Why is this thread stuck?

04 Token network

CONCEPT ONLY

How might capacity be coordinated?

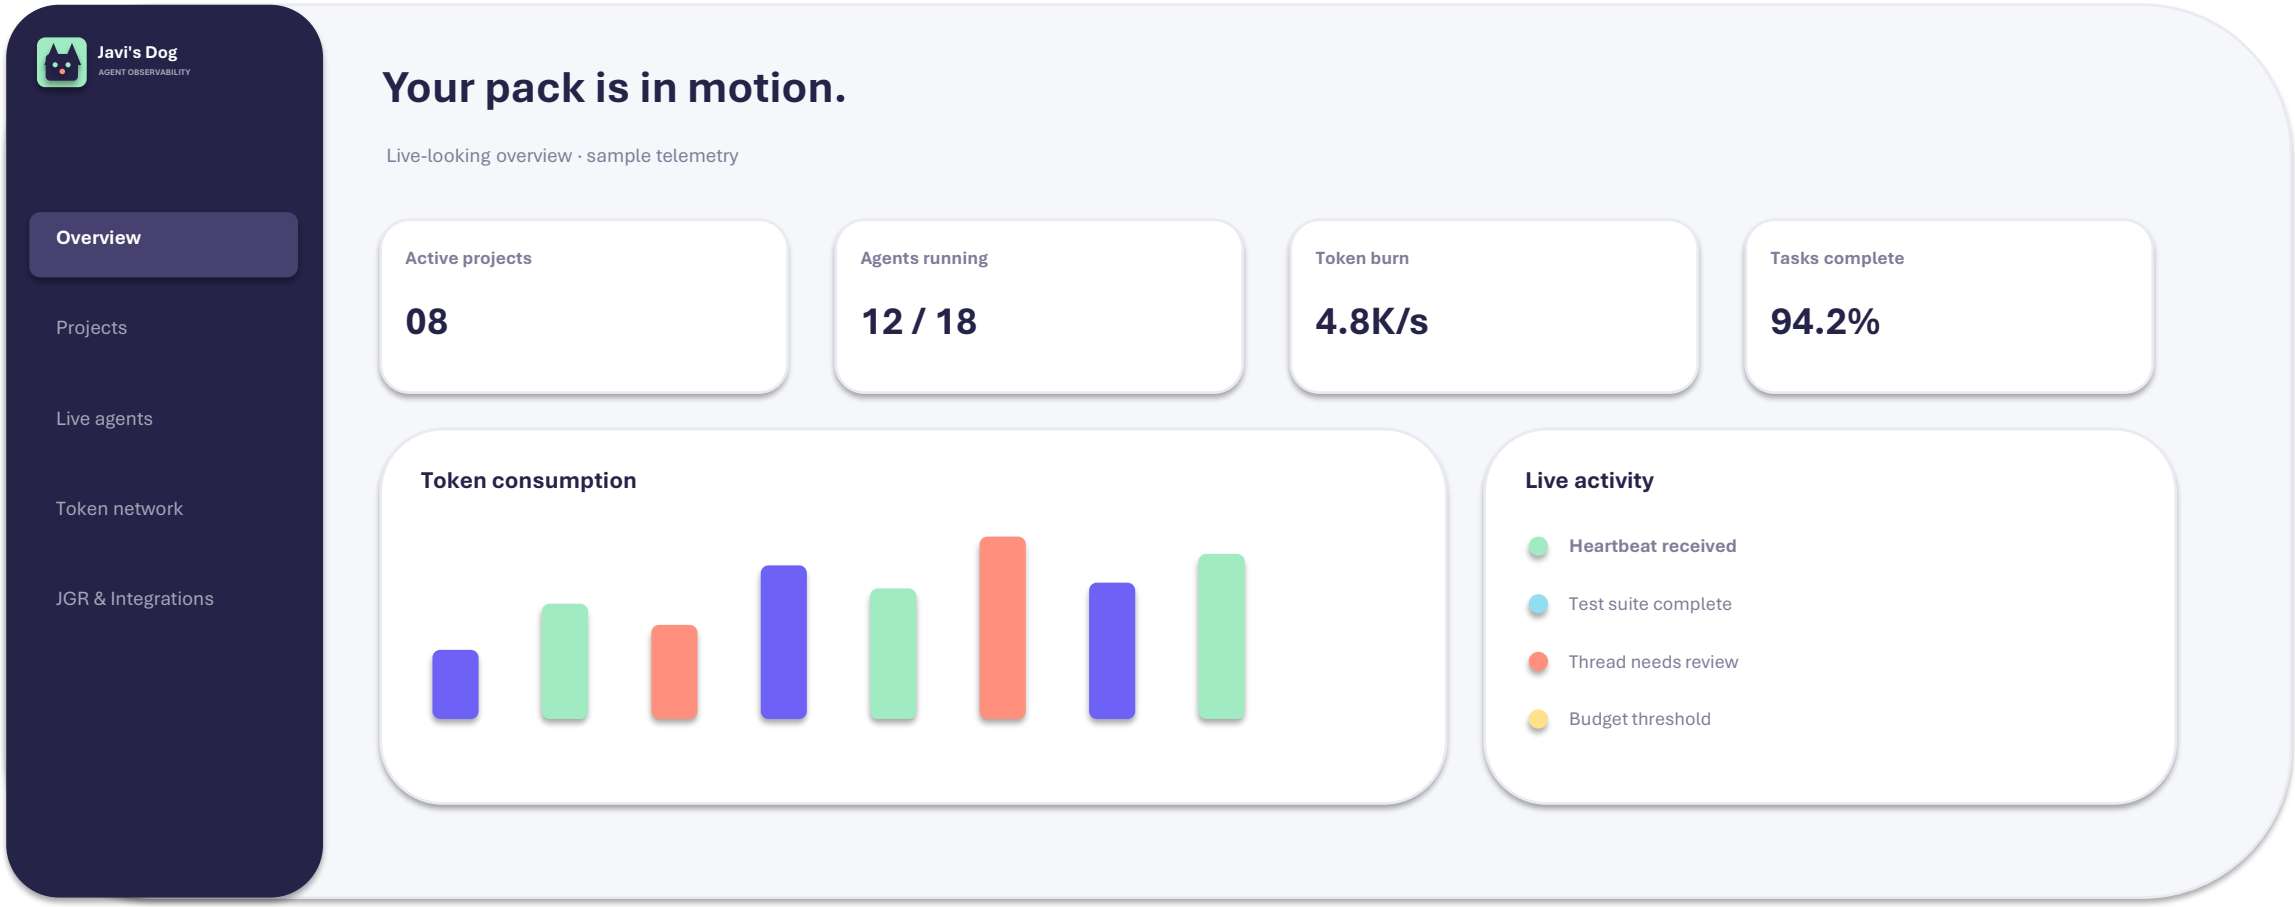

05 JGR & Integrations

Can I trust the incoming signal?

Navigation stays simple. Deep complexity appears only when the user drills into the project, thread, usage or event details.

The Pack Dashboard makes the signal scannable.

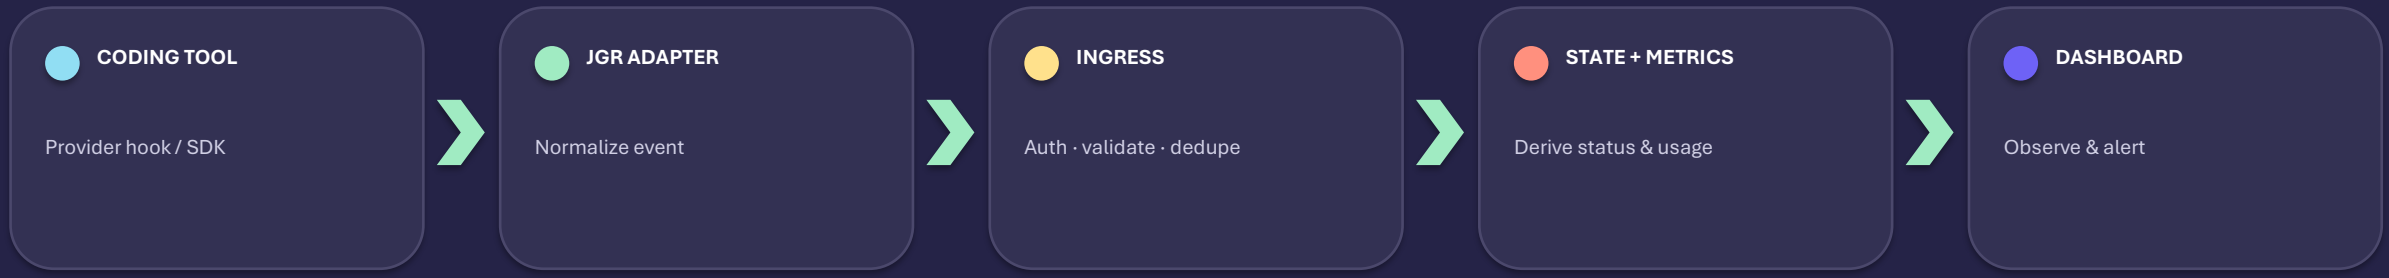

Example dashboard composition from the interactive prototype. Values shown here are illustrative sample data only.

Design intent: 3-second scan for health, capacity and attention. Drill-down should always retain event provenance and freshness.

JGR is the shared language beneath the UI.

A versioned, privacy-aware event contract turns vendor-specific hooks into consistent project/thread state.

EVENT ENVELOPE · DRAFT

event_id · protocol_version · producer_id · project_ref · thread_ref · agent_ref · sequence · status · occurred_at · usage_delta · privacy_class

DEFAULT PRIVACY BOUNDARY

Operational metadata by default. No prompts, source code or secrets in the default event payload. Scoped auth, replay protection, retention, revocation and truthful delivery status are required.

Target p95 < 2s and payload < 4 KB are initial hypotheses only; measure under a defined load before publishing an SLA.

Prove the signal path before expanding the network.

The plan is gated by evidence, not calendar promises. Sprint length is set after the actual app repository is discovered.

S0

Discovery & readiness

Inspect repo, assets, auth, Neon, Resend, Vercel, tests

S1

Brand shell & registry

Design system, nav, states, project registry

S2

Identity & projects

SSO, membership, CRUD, authorization

S3

JGR ingress

Schema, scoped auth, validation, dedupe

S4

Live state & analytics

Thread state, usage, freshness, alerts

S5

Adapter hardening

One real adapter, retries, tests, release docs

S6

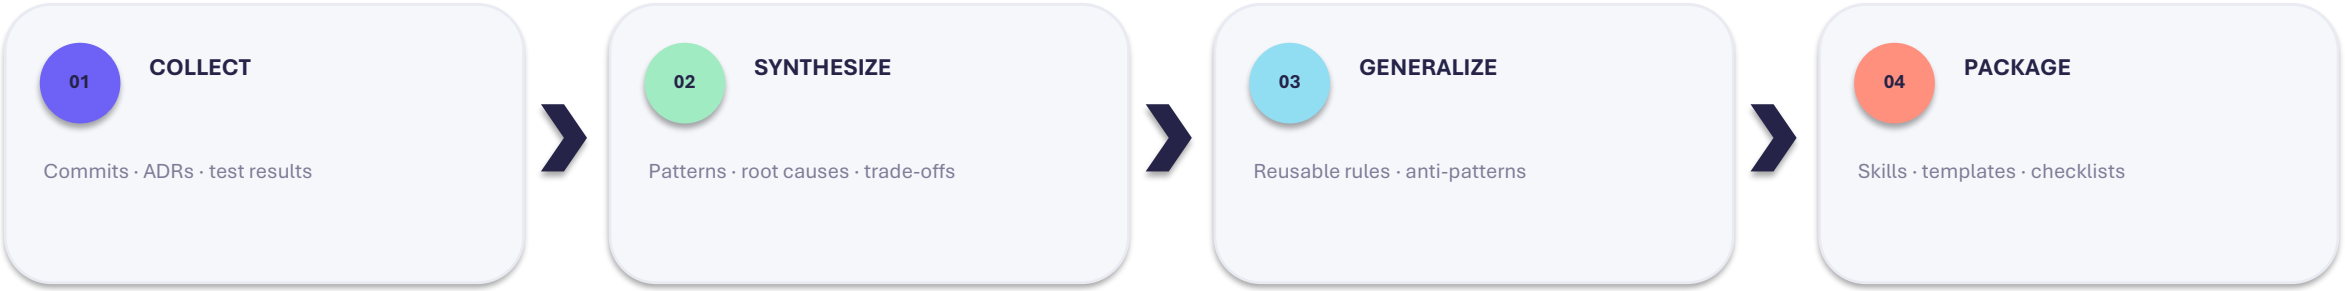

Pack Pool research

Provider terms, economics, abuse, revocation

Release gate: working end-to-end telemetry + verified access boundaries + test evidence + rollback plan.

Javi's Guru turns project history into reusable wisdom.

A checkpoint agent that curates lessons, not just a meeting summarizer — with evidence, confidence and human review.

CHECKPOINTS

Sprint start · Architecture/protocol · Feature/test completion · Incident review · Sprint end · Pre-release

WISDOM QUALITY BAR

Verified finding ≠ hypothesis.
No secrets. No invented root causes.
Owner review before shared policy changes.

Durable memory lives in version-controlled docs and candidate skills — not only in chat context.

Be ambitious about the vision. Exacting about the proof.

The design work can move now; production implementation needs the real app repository and runtime evidence.

BLOCKER	**Actual Javi's Dog application repository**	Provide/create target app repo; Orcasus is only a skills library.
UNKNOWN	**SSO · Neon · Resend · Vercel**	Verify account, schema, scope, sender domain and environments.
HIGH RISK	**JGR privacy and delivery contract**	Approve event fields, versioning, idempotency and retention policy.
GATED	**Pack Pool / token coordination**	Provider terms, policy, abuse controls and unit economics before build.

Recommended next move: approve the creative direction + MVP boundary, then run S0 discovery in the actual application repo.

References & honest delivery boundary

This deck is a creative and product proposal. It does not assert a production app, account or provider integration exists.
